

# Roogle

a retrieval information system  
for medical research

## Convergence with I2B2

Marc Cuggia & Nicolas Garcelon

Inserm U936 Rennes – Fondation Imagine - Paris

# Objective of Roogole project

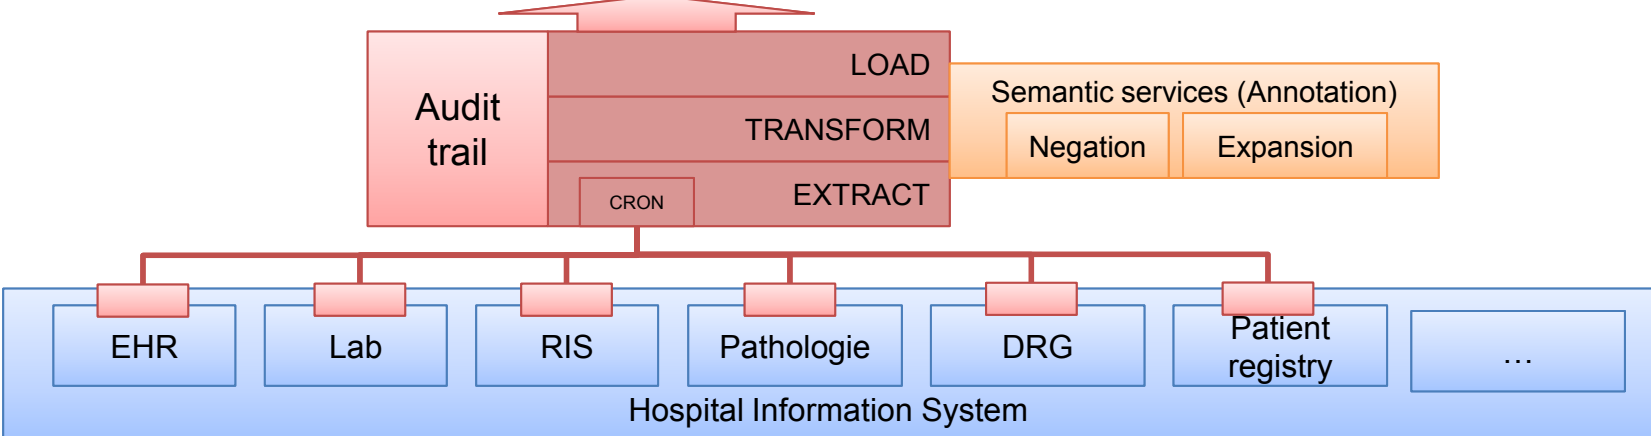

- To develop a global retrieval information system for medical research
- Dealing with freetext and coded data
- Providing tools to select patients or cohort
- Quite similar to existing tools (I2B2, Stride, Archimed)

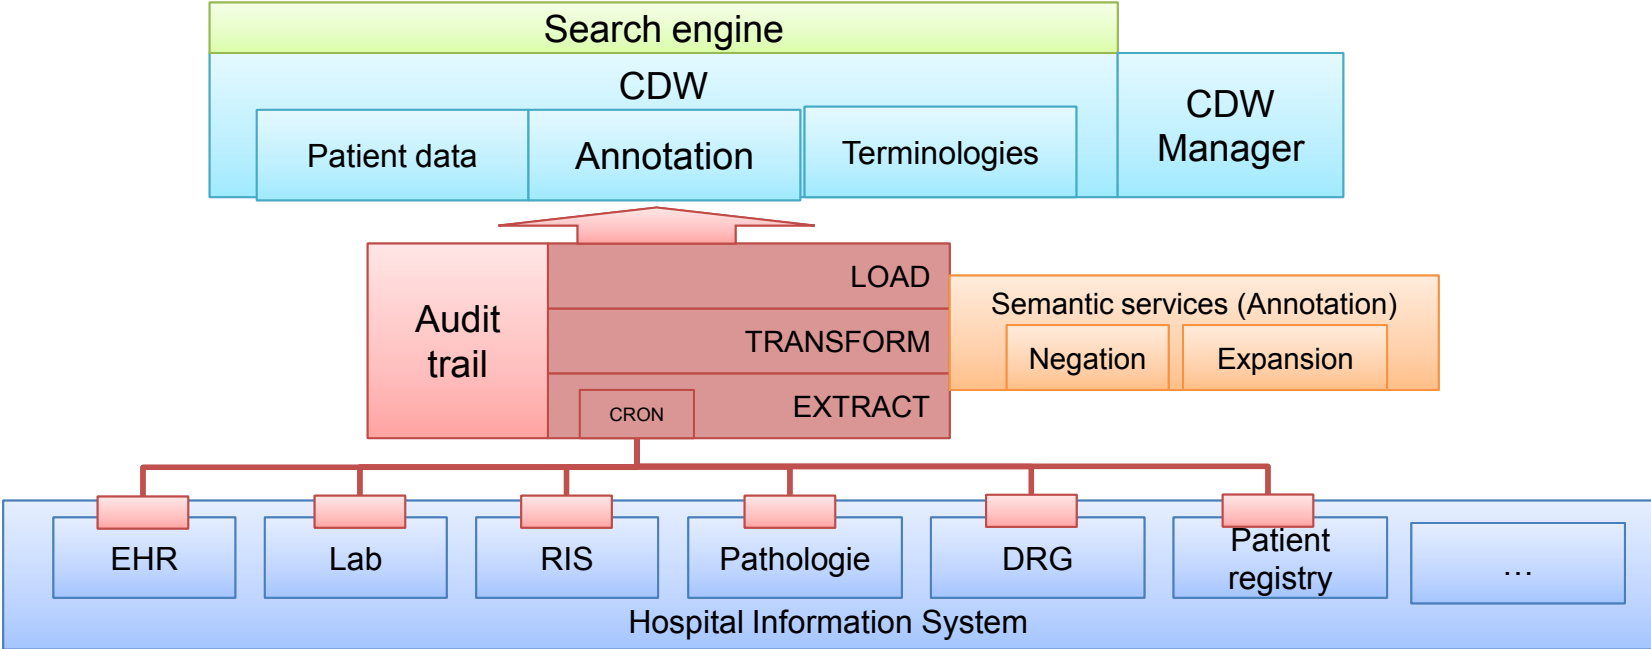

# Goal of the presentation

- To present Roogle from
  - a technical
  - functional point of view
- To imagine how Roogle could interact with I2B2

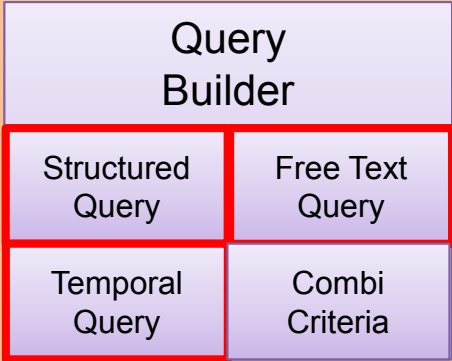

# Technical aspect of Roogole (1)

- Web tool
- Languages : PHP, Ajax
- Database : Oracle
  - Oracle Text
  - Oracle Geolocation
- ETL : Perl scripts / Talend
- Terminology system : UMLS

Hospital Information System

# Functional description

- Demo Roogle
- Example taken from a realistic clinical trial
- Find patients with the following criteria :

+ Age : 30 to 90 years

+ Finding : dyskinesia

+ Drugs : rasagiline or selegiline or deprenyl or Otrasele or LDopa

+ Diagnosis : parkinson disease

Inclusion

Exclusion

- Diagnosis : hypertension

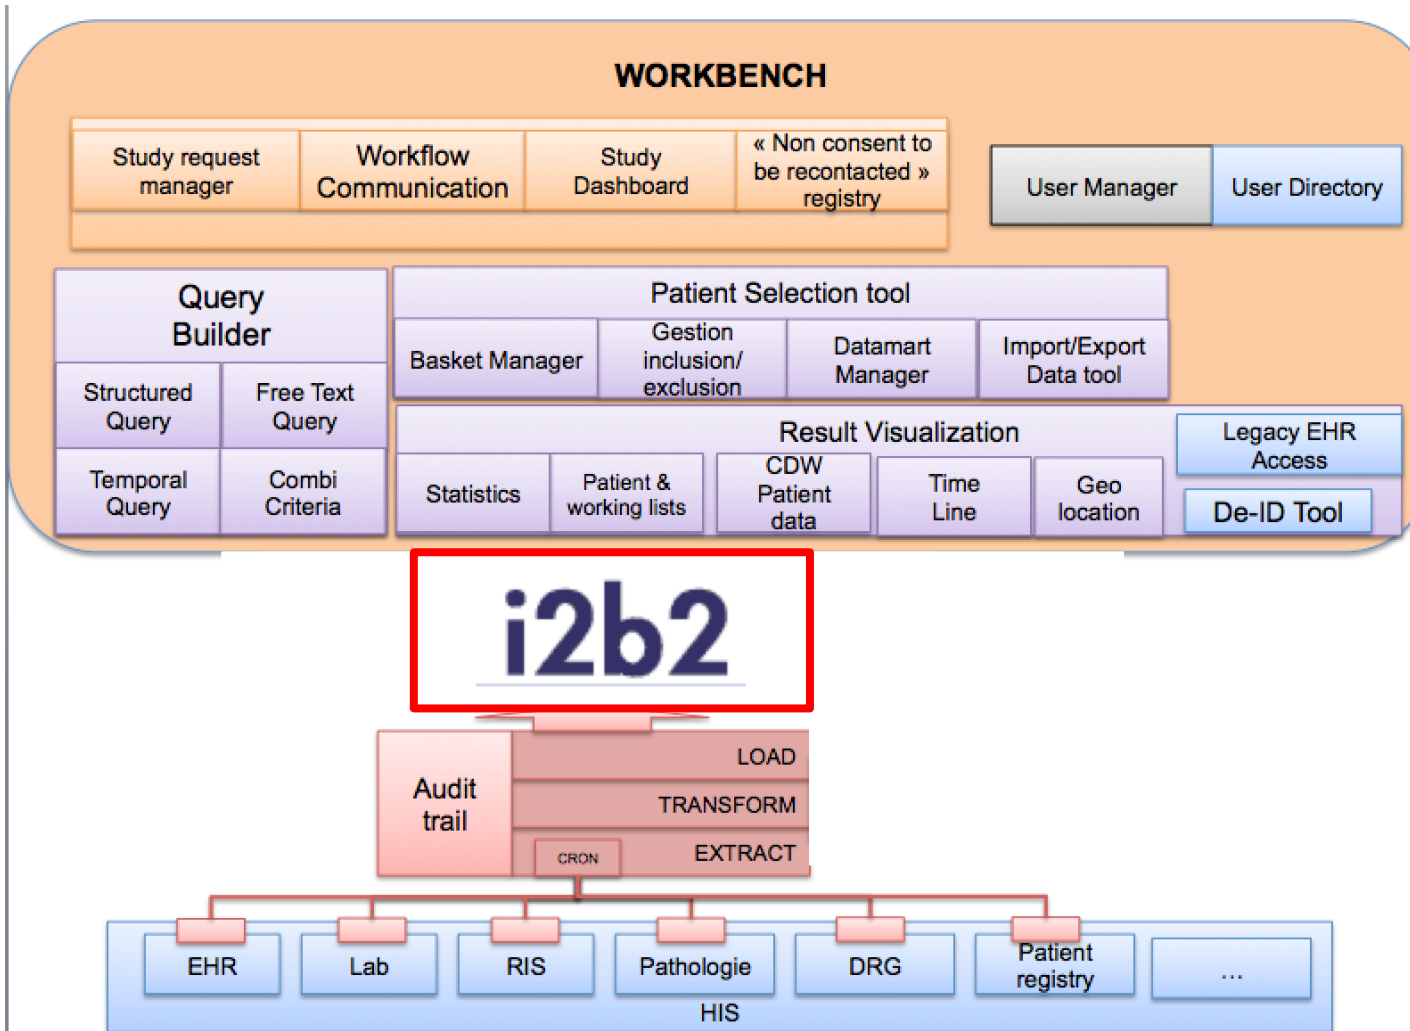

Roogle

# Converging with I2B2

- I2B2 is becoming a standard in CDW
  - with a modular approach (Hive - cells)
  - supported by a large community of developers
- How to take benefit of I2B2 & Roogle ?

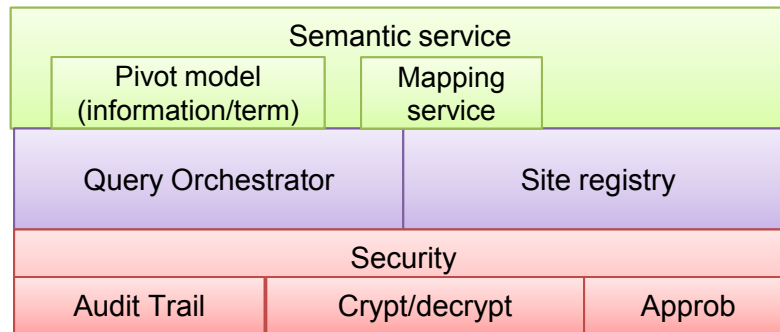

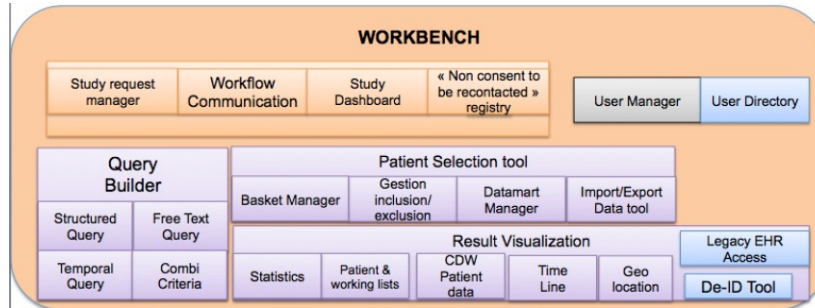

# Scenario 1

## Roogle as workbench on I2B2 DATABASE

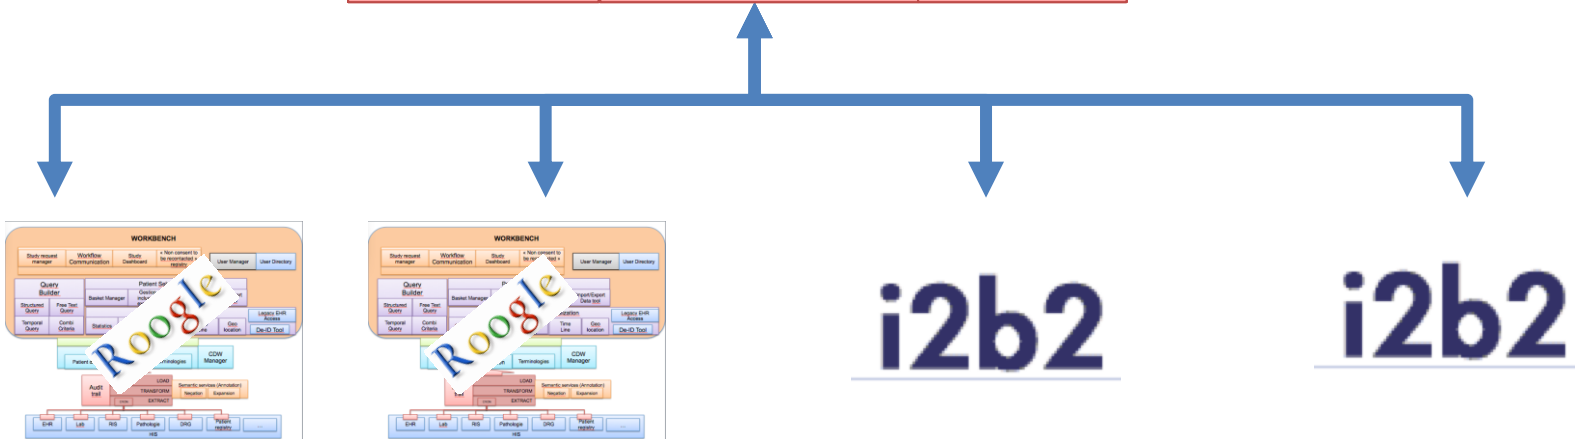

# Scenario 2

Roogle as Shrine and I2B2 as an endpoint

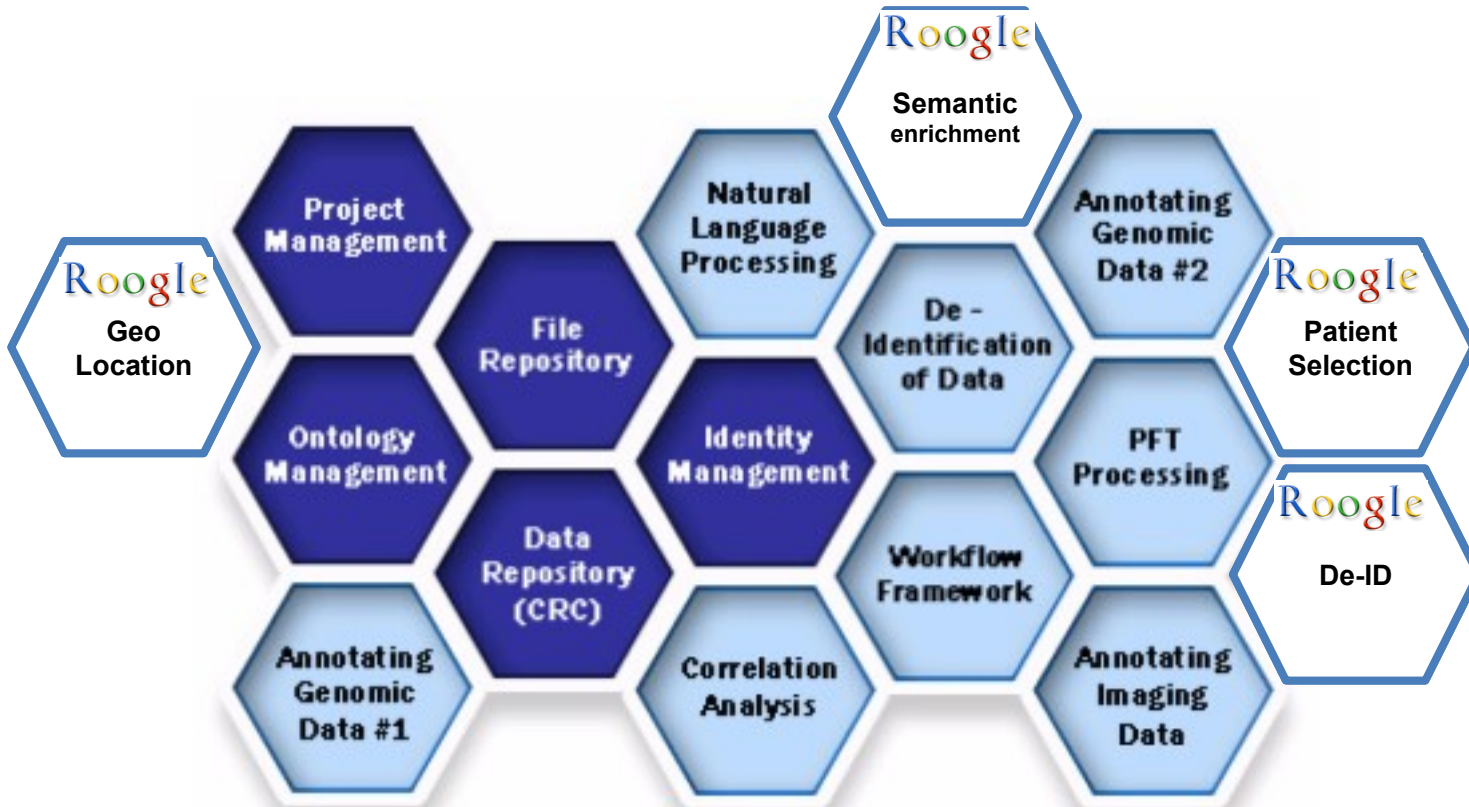

MEDIATOR

# Scenario 3

- Roogle modules as re-usable components in the I2B2 Hive.

# Conclusion

- Roogle is an information retrieval system for medical research
- Currently used in 3 academic hospitals
- Planned to be deployed in 20 cancer hospitals in France
- Roogle & I2B2 could have some point of converge with different strategies
